

## Barcode technology

Nowadays smartphones have become real mobile computers. It is quite feasible to create mission critical mobile enterprise applications using smartphones to support the field force. Applications can be easily envisioned within logistics, transportation, parcel delivery, mobile sales, retail and other sectors.

Field workers can use smartphone applications which replace paper forms. Traditionally ruggedized handhelds are used for these type of applications. A key missing component in smartphones is barcode scanning.

Inmote ("INto MOBILE TEchnology") partners with Opticon to provide a solution here – the OPL 2724 – a simple Bluetooth barcode scanner.

### Features

- Low cost, small, easy to use and very portable Bluetooth barcode scanner
- runs on two AA batteries which can be purchased everywhere – no charger needed
- mobile enterprise applications based on smartphones and a Bluetooth barcode scanner ownership as the ruggedized handheld alternative.

### Why us?

Inmote is one of the most innovative providers of mobile solutions serving a global customer base with the development of mobile client applications and trainings on mobile application development.

Our consultants are knowledgeable in many business domains. We are capable to provide you with a mobile business application quickly and tailored specifically for your situation. We partner and work with
