

Network Select for S60

Enterprises nowadays deploy femto cells and pico cells on their company premises. In the UK and the Netherlands companies are allowed to deploy their own low power private GSM network (PMNs). In the Netherlands a GSM frequency license can be obtained from "het Agentschap Telecom".

When compared to DECT and VOIP handsets GSM handsets have the advantage of supporting the full set of data communication functionality including SMS. GSM handsets consume less battery than WiFi based handsets. There is choice from numerous standard GSM handsets. Further you only need to carry one mobile handset instead of two when using a private GSM network on your company premises.

Description

Using Network Select the user can easily register with the company private GSM network once the company private GSM network is within reach. The current application provides functionality to list the GSM networks which are in reach and to register on one of these networks provided the SIM card you have allows you to register in other networks. The network of course needs to allow you to be registered in the network.

Supported devices

Network Select can run on any Series 60 3rd Edition handset. Series 60 is the platform of choice for Nokia. Nokia E-Series and N-Series handsets are power by Series 60.

Licensing

For licensing options including source code delivery, send an e-mail to info@inmote.com to discuss your project requirements. Customization of the solution to automatically select and register to the company private GSM network is possible.
