

## Voting application: Most Valuable Player

Sports and mobile are fun! Using a mobile voting application sports can be even more fun. During the game supporters of a team can query profile information for the players using their mobile device. Also this application allows you to setup a voting competition to choose the Most Valuable Player (MVP) for the match. Here are some screenshots for the Dutch Basketball League:

### Description

Voting is performed via SMS. People will download all data for both teams into their mobile phone via WiFi or GPRS prior to the match. Voting is only possible during the match.

The user can access background information about all players during the match by exploring the profile and statistics of the players.

At the end of the game all voters optionally get informed per SMS about the most valuable player chosen and one of the voters will be selected for a price.

Along with the application comes a credit based payment system.

### Supported devices

The voting application can run on any Series 60 3<sup>rd</sup> Edition handset. We have a roadmap to support further handsets. Contact Inmote for inquiries.

### Licensing

For licensing options, send an e-mail to [info@inmote.com](mailto:info@inmote.com) to discuss your project requirements. The voting applications can be customized by Inmote for different types of sports as well as for different types of events.
